## Brainstorming

During this phase it is expected that we are just to get together as a group and allocate the correct roles to the correct people. We mostly must focus on what is the best approach to complete this project and as well as the best coding language is for such a project. It is as well ideal that we write up some algorithms or draft coding files. Because we are different people from various backgrounds it must be good to ensure that everyone understands how the final product works in different stages of development.

## Design

During this stage it is ideal that the final approach to the project is set, and we figured out how to put this project into the correct formal. This section would involve design the front end while at the same time the programmers begin the coding for the backend.

## Programming

During this stage this when the most intensive works takes place, we must begin the program the project. It might take long but however it shouldn't be difficult if we correctly followed the correct procedures first. We will allocate who will take on the weight of the programming when the time comes.

## Integration

This should not take too long. Once the programming is done we should proceed to upload the submission files onto to the correct places to ensure that it works i.e. upload it to GitHub, and/or the university server as Josh did with the previous deliverable.

## Quality assurance

Make sure it works to the correct specifications.

## Submission

Submit the assignment by 8 November 2022.
